Crystalline Silica Dust

What are the possible exposure sources?

Crystalline silica can be found in certain types of natural materials, such as:

- Sand
- Soil and rock
- Gravel
- Sandstone
- Slate
- Granite
- Clay

Typical construction materials made from these natural ingredients include:

- Roof tiles
- Ceramic and terracotta tiles
- Concrete and concrete block
- Manufactured stone
- Bricks and blocks
- Grouts and mortar
- Some joint compounds
- Abrasive materials

These become some of the sources of exposure associated with a number of the construction trades.

**Exposure Levels**

Airborne exposure to crystalline silica dust can depend on a number of things, such as:
1. Types of activities

- **Cutting, drilling and coring**
  1. Concrete
  2. Roof tile
  3. Tile backer board
  4. Brick and block
  5. Granite

- **Grinding, Sanding and Sandblasting**
  1. Sack and patch
  2. Tuck point grinding
  3. Scabbling/scarifying
  4. Drywall mud sanding
  5. Hand-held surface grinding

- **Pulverizing**
  1. Jack and chipping hammers
  2. Cement truck cleaning
  3. Concrete recycling
  4. Road milling
  5. Backhoes, excavators
  6. Demolition

- **Mixing (dry)**
  1. Cement
  2. Plaster and grout

- **Cleaning up**
  1. Dry sweeping (versus wet)
  2. Compressed air (versus vacuum)
  3. Hauling
2. Location
   - Outside or in a wide open area versus inside or an enclosed area

3. Materials being used
   - The percentage of silica present varies a lot. The higher the content, the more likely overexposure will occur

4. Types of equipment used
   - Cutting using wet methods versus dry methods
   - Types of blades or abrasives used
   - Use of local ventilation that prevents or reduces the amount of dust you breathe

5. How long the dust-generating activity goes on in a shift
   - The longer the duration of exposure, the greater the chance of overexposure

6. Weather conditions
   - Presence of moisture
   - The lighter the wind the less likely airborne dust generated will move away from the breathing zone and be quickly diluted. On the flip side, wind currents can move the hazard away from one person to another.
Sources of Exposure Information

What are your chances of being overexposed?
(Based on a Summary of University of Washington Studies)

The probability (in %) of being overexposed
(based on the Cal/OSHA PEL of 0.1 mg/m³ of air for respirable quartz silica)

Allowable Exposure Levels

Cal/OSHA has established regulatory permissible exposure levels for silica that varies depending on the form of silica (quartz, fused, tripoli, tridymite and cristobolite) and particle sizes present. These allowable exposure levels are reflective of an employee's average exposure throughout an 8-hour shift. There is a difference between "total" and "respirable" silica dust, in that "respirable" silica dust is more likely to get into the deep parts of the lungs and cause more serious damage.

- Cal/OSHA’s Permissible Exposure Levels over an 8-hour average basis
  1. Respirable crystalline silica (quartz, fused, tripoli), 0.1 mg/m³ - 0.1 milligrams of Silica in 1 cubic meter of air.
  2. Total crystalline silica (quartz), 0.3 mg/m³.
  3. Respirable cristobolite and tridymite, 0.05 mg/m³.
NOTE: Special exposure sampling methods are needed to collect the "respirable" fraction of the dust you are exposed to. If not done properly, this type of sampling can easily be inaccurate and give you misleading results.

It's important to note that there are other exposure guidelines from NIOSH (National Institute of Occupational Safety and Health) and ACGIH (American Conference of Industrial Hygienists). Although not enforceable by Cal/OSHA, you should still take them into consideration.

- NIOSH recommends an exposure level of 0.05 mg/m³ on an 8-hour average basis
- ACGIH recommends an exposure level of 0.025 mg/m³ on an 8-hour average basis.

  1. ACGIH currently lists crystalline silica as a known human carcinogen.

- Crystalline silica is currently on the California Prop 65 List of substances known to the State of California to cause cancer

What's the hazard?

Each year more than 300 U.S. workers die from silicosis and thousands more are diagnosed with the lung disease. It is frequently misdiagnosed, so actual numbers may be quite higher.

Silica is a natural mineral that comes in several Crystalline forms, some more hazardous than others, such as:

- Quartz
- Fused
- Tripoli
- Cristobolite
- Tridymite

Crystalline silica dust is made up of a variety of particle sizes. Particle sizes small enough to reach the deep parts of the lungs are referred to as "respirable", which are more likely to cause:

- "Silicosis", which is a scarring of the lung tissues,
- Lung cancer
- Chronic obstructive pulmonary (lung) disease (COPD)
- Decreased lung function
- Increased risk of getting tuberculosis
It's important people working with silica-containing materials understand:
With lower exposures over longer periods of time it usually takes several years before you know that you have a problem.

- Higher exposures can produce health problems much sooner.
- At first, there can be no symptoms of disease, and then
  - Shortness of breath.
  - Chest pain
  - Persistent dry coughing
  - Loss of appetite and weight loss
  - Extreme fatigue
  - Fever
  - Nails with a bluish tint
- Short of a lung transplant, silicosis cannot be cured. Doctors can only treat the symptoms to provide some comfort. It's best to minimize exposures now to prevent disability later in life.

The symptoms and other health affects listed above can be caused by other things besides exposure to silica. Make sure and get evaluated by a board certified occupational medicine physician.

Additional Sources of Information
- NIOSH
- Washington State
- OSHA
- OSHA guidance document 'Controlling Silica Exposures in Construction'. Note that this guide references the OSHA program and related standards. Employers in California need to abide by Cal/OSHA regulations.

Respirators must be used if silica dust can’t be controlled with water or ventilation

Employees using respirators must be trained on how to use them
EMPLOYEE TRAINING AND INSTRUCTION RECORD

Subject: Silica Dust

Location: ______________________________

Instructor’s name & Signature: ______________________________

Date of Session: / / Time Started : am / pm  Time Finished : am / pm

Please print your name and job title. Then sign your name.
